

How Does Saffire's Crucible Kamado Firebox Fit in Other Name Brand Kamados?

Kamados come in different shapes and sizes. It's possible our Crucible Firebox will work in your kamado, even though it may not be a Saffire. This guide should help you determine if our Crucible Firebox will fit for you.

In the photo below, you will see the left side of the photo represents our Large Crucible Firebox size, while the right side of the photo represents our XL Crucible Firebox size. Horizontal lines represent diameter (not radius), despite the blue separation line.

How to Measure

Since the shape of kamados are all different, you should check the diameters of our firebox at all three levels in your grill. That's because the bottom 3.5" of our unit tapers in faster than the upper portion. Just use a tape measure to check the diameters at the bottom, 3.25" up, and then at the full height specified (12.5" or 13 1/8")

Also note the tension bolt flange that sticks out about 1/2" on one side of the Crucible at the top and in the middle. Add this extra dimension to the diameters shown to get the true required diameter.

Additional Notes

The Crucible has a hole in it to accommodate our Smokin' Chip Feeder tool (our patented wood chip feeder tool). The Crucible is highly efficient even with this hole, and will work fine in your grill, just as it does in a Saffire. However, we can put a solid brick in place of the one with a hole in it if you like. There will still be a circular hole in the metal, but that won't have any effect on the performance of the firebox. Feel free to ask us about this option.
